The present invention relates to an isolated nucleic acid that encodes an intestinal trefoil factor (ITF) polypeptide. The intestinal trefoil factor can be used to treat peptic ulcers and inflammatory bowel diseases and to protect the intestinal tract from injury caused by bacterial infection, radiation surgery or other insults. It may also be used to protect and stabilise other proteins in the digestive tract. The present sequence is an oligonucleotide used in the isolation of human ITF (hITF)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                    A nucleic acid encoding an intestinal trefoil factor is useful to treat peptic ulcers and inflammatory bowel disease, and to protect the intestine against injury from insults such as bacterial infection and radiation surgery.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              acid sequence. TANGO protein is used to identify a compound which binds to it that can be used for modulating its activity. It is also used to produce an antibody. The antibody is used to detect the presence of the polypeptide in a sample. TANGO DNA and protein are useful as modulating agents in regulating cellular processes. They can be used in vaccines. TANGO DNA and protein and its antibody are used in e.g. chromosomal mapping, tissue typing, forensic biology, predictive medicine, pharmacogenomics and treatment methods. TANGO DNA is used in antisense gene therapy. The present sequence is human TANGO 239 form 1 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to genetic variants of human neurotrophin (NTF) 3 gene. The invention also relates to compositions and methods for heplotyping and/or genotyping the NTF3 gene in an individual. Sequences of the invention are useful for studying the expression and function of NTF3 protein for use in screening for candidate drugs to treat diseases related to NTF3 activity. The polymorphism and haplotype data is useful for validating whether NTF3 is a suitable target for drugs to treat drugs concerns system disorders and congenital heart defects, screening for such drugs and reducing bias in clinical trials of such drugs. They are also useful for therapeutic purposes. The haplotyping method is useful for such and outcome of several steps in the discovery and development of drugs for treating diseases associated with NTF3 and eactivity such as nervous system disorders and congenital heart defects. It is also useful for validating NTF3 as a candidate target for treating a specific condition or disease predicted to be associated with NTF3 curivity. Commence of the invention are also useful for screening compounds to treat a specific condition or disease predicted to be associated with NTF3 and continuity. The method is also useful for screening compounds to treat a continuity of the properties of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polymorphic variants of neurotrophin 3 (NTF3), useful for studying the expression and function of NTF3, and for screening candidate drugs to treat nervous system disorders and congenital heart defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                activity. Sequences of the invention are also used in gene therapy. The present DNA sequence is a primer used to detect human NTF3 gene

The invention relates to a DNA array for identifying cancer related genes. The DNA array comprises: (a) statistically significantly higher results of over 10% in homology search of a DNA molecule describing different genes or a complementary DNA (cDNA); (b) statistically significantly higher results (p value) of over 10% in homology search with human Alu sequence; (c) difference of melting temperature of the DNA fragment and hybridisation temperature at 30 degree C or less; (d) the DNA fragment prepared by immobilisation of a DNA short sequence with a specific higher order structure; and (e) the DNA fragment without short repetitive sequence. The array is used in elucidation of the action mechanism of anticancer agents. ABK92989-ABK93090 represent human cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A DNA array that observes the expression of cancer related genes is useful for the elucidation of the action mechanism of anticancer agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes an isolated polynucleotide comprising a nucleotide sequence which is a polymorphic variant of a reference sequence for the aldehyde dehydrogenase 5 family, member Al (succinate-semialdehyde dehydrogenase) (ALDHSA1) gene or its fragment. The comparison of the ALDHSA1 polymorphic variant with a candidate agent and assaying for binding activity. The polypeptide and haplotypes are useful for identifying an association between a trait such as a clinical response to a drug targeting ALDHSA1 and a haplotype ALDHSA1 gene. Transgenic animals care also useful for studying expression of the ALDHSA1 isogenes in vivo, for in vivo screening and testing of drugs against ALDHSA1 protein and corresponding to testing the efficacy of therapeutic agents and compounds for 4-thribodies are useful for idenomials adjunctic diseases in a biological system. Antibodies are useful for immunopractic and prognostic formats and tharapeutic methods, for immunopractipitating the polypeptide from solution, for detecting ALDHSA1 protein isoforms in biological samples, forzen these sections, for immunofluorescence techniques. The polymucleotide is useful for gene therapy and antisense gene therapy. This sequence is a primer extension oligonalleotide used to detect polymorphisms in the arrent enterminate the efficiency of the enterminate of the entermy and antisense gene therapy. This sequence is a primer extension oligonalleotide was the enterminate of the entermi

```
The invention relates to genetic variants of human synaptosomal-associated protein, 29 kD (SNAP29) gene. The invention also relates to compositions and methods for haplotyping and/or genotyping the SNAP29 gene in an individual. Polymuclectides of the invention are useful for studying the expression and function of SNAP29 and expressing SNAP29 protein for use in screening candidate drugs to treat diseases related to SNAP29 activity. They are also used in gene therapy. The genotyping method is useful for determining if an individual has one of haplotype or haplotype pairs. The polymorphism and haplotype data is useful for haplotype pairs. The polymorphism and haplotype data is useful for validating whether SNAP29 is a suitable target for drugs to treat disorders related to membrane trafficking, screening for such drugs and reducing bias cells in clinical trials of such drugs. The present sequence is a primer for detecting human SNAP29 gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                  Novel isolated polynucleotide, a polymorphic variant of synaptosomal-associated protein, 29 kD (SNAP29) gene useful for expressing SNAP29 protein isoform to screen drugs to treat SNAP29 activity-related disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel dominant negative mutant sequence or constitutively active mutant

                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                          This invention relates to a novel dominant negative or constitutively active mutant sequence of the cardiac-associated Myo/V1 protein (MP). The invention may be useful for the development of compounds with a cardiant, vasotropic, immunosuppressive or vulnerary activity through the inhibition of formation of NekappaB p50 or NekappaB p55 homodimers. The invention may be useful for the development of treatments for activity and secular disease including cardiac hypertrophy, myocardial infarction, ischaemia/reperfusion injury and heart transplantation, in a mammal, for anti-ageing treatment, for inhibiting formation of NekappaB p50 homodimers or NekappaB p65 homodimers in a cell of a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel dominant negative or constitutively active mutant sequence of the cardiac-associated Myo/V1 protein (MP). The invention may be useful for the development of compounds with a cardiant, vasotropic, immunosuppressive or vulnerary activity through the inhibition of formation of NfkappaB p50 or NfkappaB p55 homodimers. The invention may be useful for the development of treatments for cardiovascular disease including cardiac hypertrophy, myocardial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cardiant; vasotropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cardiac-associated protein; Myo/Vl protein; MP; cardiant; vasotropic immunosuppressive; vulnerary; NFkappaB p50; NFkappaB p65; cardiovascular disease; cardiac hypertrophy; myocardial infarction; ischaemia; reperfusion injury; heart transplantation; anti-ageing treatment; human; ds.
sequence of Myo/V1 polypeptide, useful for treating cardiovascular disorders and inhibiting formation of NFkappaB homodimers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel dominant negative mutant sequence or constitutively active mu sequence of Myo/V1 polypeptide, useful for treating cardiovascular disorders and inhibiting formation of NFkappaB homodimers.
                                                                                                                                                                                                                                                                                                                                                                                                                                  ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human Myo/V1 protein-related NFkappaB regulation site SegID330.
                                                                                                                                                                                                                                                                                                                                                                                                                                0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel dominant negative or constitutively active mutant sequence of the cardiac-associated Myo/VI protein (MP). The invention may be useful for the development of compounds with a cardiant, vasotropic, immunosuppressive or vulnerary activity through the invention of formation of NFkappaB p50 or NFkappaB p55 homodimers. The invention may be useful for the development of treatments for cardiovascular disease including cardiac hypertrophy, myocardial infarction, ischaemia/reperfusion injury and heart transplantation, in a mammal, for anti-ageling treatment, for inhibiting formation of NFkappaB p50 homodimers or NFkappaB p55 homodimers in a cell of a mammal.
mammal, for anti-ageing treatment, for inhibiting formation of NFkappaB p50 homodimers or NFkappaB p65 homodimers in a cell of a mammal and for reducing formation of NFkappaB p65 homodimers in a cell of a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel dominant negative mutant sequence or constitutively active mutant sequence of Myo/V1 polypeptide, useful for treating cardiovascular disorders and inhibiting formation of NFkappaB homodimers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel dominant negative or constitutively active mutant sequence of the cardiac-associated Myo/VI protein (MP). The invention may be useful for the development of compounds with a cardiant, vasotropic, immunosuppressive or vulnerary activity through the inhibition of formation of NPRappaB p50 or NPRappaB p56 homodimers. The invention may be useful for the development of treatments for cardiovascular disease including cardiac hypertrophy, myocardial infarction, ischaemia/reperfusion injury and heart transplantation, in a mammal, for anti-ageing treatment, for inhibiting formation of NPRappaB p50 homodimers or NPRappaB p55 homodimers in a cell of a mammal and for
                                                                                                                                                                                                                                                                                                                                                                                                                                   mutant

This invention relates to a novel dominant negative or constitutively active mutant sequence of the cardiac-associated Myo/VI protein (MP). The invention may be useful for the development of compounds with a cardiant, vasoctropic, immunosupressive or vulnerary activity through the inhibition of formation of NPkappaB p50 or NPkappaB p55 homodimers. The inhibition may be useful for the development of treatments for cardiovascular disease including cardiac hypertrophy, myocardial infarction, ischaemia/reperfusion injury and heart transplantation, in a mammal, for anti-ageing treatment; for inhibiting formation of NPkappaB p55 homodimers in a cell of a mammal and for reducing formation of NPkappaB p55 homodimers in a cell of a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cardiac-associated protein; Myo/Vl protein; MP; cardiant; vasotropic; immunosuppressive; vulnerary; NFkappaB p50; NFkappaB p65; cardiavorascular disease; cardiac hypertrophy; myocardial infarction; ischaemia; reperfusion injury; heart transplantation; anti-ageing treatment; human; ds.

The invention relates to a method of constructing gene networks by providing a quantitative disruptant data library for a set of genes of an organism, including expression results of disruption of each disruption for quantifying average effect and variability measure of each disruption for every other gene, creating gene expression matrix, generating network cevery other gene, creating gene expression of gene groups. The method is useful for constructing gene network for genes of organism to predict putative therapeutic targets The method provides internal control and quantitative measurement of the direct effects of the presence or absence of the gene on the expression of other genes.

Therefore selection of disruptant experiments to maximize the elucidation of gene control relationships is adhieved to generate useful gene control relationships is achieved to generate useful gene regulatory information. To illustrate the invention, Multiple Expectation -Maximization for motif Elicitation (MEME) was performed on 34 genes controlled by UME6, a global transcriptional regulator of meiotic genes.

This consensus sequence was found in 32.4% of genes examined. This sequence is defined as the binding site for a repressor of the CARI gene
                                                                                                                      Gene network construction, involves creating gene expression matrix based on expression result of gene disruption, using Bayesian computational model such that BNRC criterion is minimum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New library comprising polypeptides having zinc finger domains, useful for producing chimeric nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Zinc finger protein DNA-binding domain target sequence SEQ ID NO:201.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel dominant negative or constitutively active mutant sequence of the cardiac-associated Myo/VI protein (MP). The invention may be useful for the development of compounds with a cardiant, vasotropic, immunosuppressive or vulnerary activity through the inhibition of formation of NFkappas p50 or NFkappas p55 homodimers. The invention may be useful for the development of treatments for cardiovascular disease including cardiac hypertrophy, myocardial infarction, ischaemia/reperfusion injury and heart transplantation, in a mammal, for anti-ageing treatment, for inhibiting formation of NFkappas p50 homodimers in a cell of a mammal and for reducing formation of NFkappas p65 homodimers in a cell of a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     binding sequence; ss; UME6; meiosis; transcriptional regulation; MEME; gene network; quantitative disruptant data library; gene expression; gene regulation; Multiple Expectation-Maximization for motif Elicitation;
                                                                                                                                                                                                                                                                               Novel dominant negative mutant sequence or constitutively active mutant sequence of Myo/V1 polypeptide, useful for treating cardiovascular disorders and inhibiting formation of NFkappaB homodimers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              à
                   The present invention describes a library comprising polypeptides. Bach polypeptide comprises a first or second zinc finger domain. The domains of each polypeptide are identical to a zinc finger domain from a naturally occurring protein and either do not occur in the same naturally occurring protein or occur in the same naturally occurring protein in a different configuration than in the polypeptide. The domains vary among polypeptides. Also described: (1) producing chimeric nucleic acids; (2) generating an artificial zinc finger polypeptide that specifically binds to a target DNA site; and (3) identifying a nucleic acid encoding a zinc finger polypeptide that specifically recognises a target DNA site. The library can be used for producing chimeric nucleic acids. ACC41551 to ACC41758 and ABR40919 to ABR41015 represent nucleocide and amino acid sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises a method for the PCR amplification of nucleic acids. The method involves a set of primers, where two of the primers are in solution and at least two other primers are attached to a solid support. The method of the invention can be used for the analysis of a nucleic acid or a mixture of nucleic acids, including: single-stranded DNA molecules, double-stranded DNA molecules and mRNA molecules. The present DNA sequence represents a random amplified polymorphic DNA (RAPD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Amplification of nucleotide sequences from polynucleotides by chain extension of oligonucleotide primers, comprises 2 oligonucleotides in solution, 2 attached to supports and both share complementary sequences.
                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises a method for the PCR amplification of nucleic acids. The method involves a set of primers, where two of the primers are in solution and at least two other primers are attached to a solid support. The method of the invention can be used for the analysis of a nucleic acid or a mixture of nucleic acids, including: single-stranded presentles, double-stranded DNA molecules, and many molecules. The PCR primer of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          extension of oligonucleotide primers, comprises 2 oligonucleotides in solution, 2 attached to supports and both share complementary sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                   88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Amplification of nucleotide sequences from polynucleotides by chain
                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid PCR amplification method-related RAPD PCR primer #132.
                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid amplification, nucleic acid analysis, DNA analysis, s
RNA analysis, RAPD, PCR, primer, random amplified polymorphic DNA.

```
The invention describes a purified and isolated gustducin alpha subunit polypeptide (I), fragment or variant possessing at least one ligand/antiligand binding activity or immunological property specific to gustducin. (I) is useful for identifying a peptide ligand/antiligand of gustducin, by contacting (I) with peptides and isolating peptides which bind to (I), and for identifying taste modifying agent. An antibody is useful for modifying taste which involves delivering Ab to taste receptor cell. The antibody is useful for purifying (I) and for blocking or inhibiting ligand/antiligand binding activities of gustducin. This sequence represents an adaptor used in the clonining of DNA encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Corneal epithelium; trefoil protein; intestinal trefoil factor; ITF; spasmolytic peptide; SP; pS2; corneal ulcer; eye surgery; traumatic physical injury; chemical exposure; peptic ulcer disease; ultraviolet light exposure; inflammatory bowel disease; eye disorder; gastrointestinal motility; corneal epithelial wound healing; antiulcer; antiinflammatory; ophthalmological; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel gustducin alpha-subunit polypeptide possessing ligand/antiligand binding activity or immunological property specific to gustducin, for identifying peptide ligand/antiligand of gustducin and taste modifying

The present invention relates to a method for the treatment of a disruption of the corneal epithelium in a patient. The method involves administering to the patient's eye a trefoil protein including intestinal trefoil factor (ITF), spasmolytic peptide (SP), pS2, or their biological fragments. The method is useful for the treatment of a disruption of the corneal epithelium in a patient. It is useful for treating corneal ulcer, or a disorder caused by traumatic physical injury, eye surgery, chemical exposure, or ultraviolet light exposure. It can also be used for treating peptic ulcer diseases, inflammatory bowel diseases, and eye disorders. The use of intestinal trefoil factor alters gastrointestinal motility in a mammal or enhances corneal epithelial wound healing. The present DNA sequence can be added to the 5'end of a primer to engineer a restriction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Treatment of disruption of corneal epithelium in patient by administering

                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method for identifying a reliable diagnostic, prognostic or staging marker for phenotypic conditions characterised by altered DNA methylation. The method involves obtaining a set of at least two genomic DNA samples, identifying primary differentially methylated CG dinucleotide sequence position and confirming the class-confirming the class-confirming the class-confirming the class-confirming the class-confirming marker for phenotypic conditions characterised by altered DNA cmethylation e.g cell proliferative disorders, metabolic disorders, central nervous system disorders, immune disorders, cardiovascular clasorders e.g. hypertension, disease of the respiratory system, sexual calsorders, inflammation, infection, drug abuse, behavioural conference in systhetical disorders, hodgkin's disease, cancer, autism, culcerative collits or Huntington's disease. The method is also useful for treating the above mentioned disorders. The present sequence is a primer colling and primer process. The present sequence is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                Identifying a reliable diagnostic, prognostic or staging marker for phenotypic conditions characterized by altered DNA methylation, e.g., cancer, comprises obtaining a set of at least two biological samples in each case having genomic DNA.

The invention relates to a method of designing a zinc finger protein. The method is useful for designing a zinc finger protein. The method provides multi-finger zinc finger proteins with improved affinity and specificity for their target sequences, as well as enhanced biological activity. The present sequence represents a zinc finger protein DNA target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Designing zinc finger protein that has three zinc fingers from N-terminus and C-terminus that bind to subsites in 3' to 5' direction, in a target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of designing a zinc finger protein. The method is useful for designing a zinc finger protein. The method provides

multi-finger zinc finger proteins with improved affinity and specificity for their target sequences, as well as enhanced biological activity. The present sequence represents a zinc finger protein DNA target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel monobactam compounds. A compound of the invention has antibacterial activity, and acts as a PBP2a inhibitor. The compounds are used as antibacterial agents. The monobactam compounds restore sensitivity of methicillin resistant Staphylococcus aureus to lactam antibiotic by targeting the molecular mechanism of resistance. The present sequence is used in the exemplification of the invention.

The invention describes a method of treating an eye disorder comprising administering to the eye a trefoil protein from intestinal trefoil factor (TTF), spsamoltic peptide (SP), pS2 or their biologically active fragments. The method is used for treating eye disorders such as superficial punctate keratitis, keratitis sica, trachoma, herpes simplex keratoconjunctivitis, cophthalmic herpes zoster, phyctennlar keratoconjunctivitis, keratoconcus or clastricial pemphigoid. The eye disorder is caused by an infection of bacteria, virus or fungi. The virus of conjunctival epithelium or inflammation of the soleral epithelium. The method provides a protective effect on the digestive tract, and the ITF promotes the maintenance of mucosal integrity and can also be used to inhibit adhesion or colonisation of the mucosa by Helicobacter pylori. This sequence represents an oligonucleotide associated with the creation of a human intestinal cDNA library for isolation of CDNA encoding human intestinal trefoil factor (TTF). Note: This sequence differs from SEQ ID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Miller S,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nyce JW,
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, 5' or 2' end genomic flanking regions, 5' intron-exon junctions or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition of the invention case in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or mallignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Once: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a mininflammatory steroid in a subject, for reducing or requiring or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition, lung inflammation, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           first active agent comprising an oligonucleotide antisense to the intention codor, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, 0' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, 0' regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or masal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinon. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, communosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entiinflammatory steroid in a subject, for reducing levels of adenosine of receptor, producing bronchodilation, increasing levels of denosine receptor, producing bronchodilation, increasing levels of ubiquinone or ung surfactant in a subject stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence date for this patent is not represented in the printed section of the printed of the subject of the printed of the subject of the subject of the printed of the subject of the printed of subject of the subject of the subject of the printed of the subject of the subject

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding regalon, 5' or 3' end ganomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatch, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, increasing and producing bronchoconstriction, increasing and a subject of a 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' incron-exon junctions, 5' or 2' end genomic flanking regions, 5' incron-exon junctions or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or mallignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entith ammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung suffactant in a subject stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed process or condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

                                                                                                                                                                                                                   The present invention relates to a method for preventing or treating cancers, such as colon, haematologic, lung, prostate, skin, thyroid, or preferably ovarian cancer. The method comprises administering an antisense oligonucleotide targeted to a nucleic acid encoding human K-RAS concogene, and medulating K-RAS expression. The oligonucleotides and method of the invention inhibit cancer cell proliferation, and are useful for preventing or treating cancers such as those mentioned above. The
                                                                                                                                                                                                                                                                                                                                                                                                                                 oligonucleotides are also useful for research purposes, or for modulating mutation-activated K-RAS expression in ovarian, colon, lung, thyroid, prostate, skin, or haematologic cancer cells. The present sequence represents human K-RAS oncogene DNA nucleotides 138-147 to which antisense oligonucleotides can be targeted
Preventing or treating cancer, e.g. colon cancer, lung cancer or ovarian cancer, comprises administering to a mammal an oligonucleotide targeted to a nucleic acid encoding human K-RAS oncogene, and modulating K-RAS

                                                                                                                                                                                                                                                                                            ð
                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                        The present invention relates to a method for preventing or treating cancers, such as colon, haematologic, lung, prostate, skin, thyroid, or preferably ovarian cancer. The method comprises administering an antisense oligonucleotide targeted to a nucleic acid encoding human K-RAS oncogene, and modulating K-RAS expression. The oligonucleotides and method of the invention inhibit cancer cell proliferation, and are useful for preventing or treating cancers such as those mentioned above. The oligonucleotides are also useful for research purposes, or for modulating mutation-activated K-RAS expression in ovarian, colon, lung, thyroid, prostate, skin, or haematologic cancer cells. The present sequence represents an antisense oligonucleotide of the invention
                                                                                                                                                   Preventing or treating cancer, e.g. colon cancer, lung cancer or ovarian cancer, comprises administering to a mammal an oligonucleotide targeted to a nucleic acid encoding human K-RAS oncogene, and modulating K-RAS

The invention describes a new zinc finger protein that binds to a target site comprising a first (F1), a second (F2) or a third (F3) zinc finger, ordered F1. F2 and F3 from N-terminus to C-terminus. The target site comprises, in the 3' to 5' direction, first (S1), second (S2) and third (S3) target subsites. The zinc finger proteins can be used for most position of the subsite, that has been optimised with respect to the location of the subsite, that has been optimised with respect to the location of the subsite within the target site. This sequence represents the target polynucleotide of a synthetic zinc finger protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          zinc finger protein; triplet target subsite; zinc finger motif; sp-1; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a new zinc finger protein that binds to a target
                                                New zinc finger protein used for recognizing triplet target subsites having nucleotide G in 5'-most position of subsite, that has been optimized with respect to location of subsite within target site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New zinc finger protein used for recognizing triplet target subsites having nucleotide G in 5'-most position of subsite, that has been optimized with respect to location of subsite within target site.

ö site comprising a first (FI), a second (F2) or a third (F3) zinc finger, ordered F1, F2 and F3 from N-terminus to C-terminus. The target site comprises, in the 3' to 5' direction, first (S1), second (S2) and third (S3) target subsites. The zinc finger proteins can be used for recognising triplet target subsites having the nucleotide G in the 5'-most position of the subsite, that has been optimised with respect to the location of the subsite within the target site. This sequence represents the target polynucleotide of a synthetic zinc finger protein of the eye in a patient comprising administering a trefoil protein to the eye of the patient. The trefoil protein is intestinal trefoil factor (ITF), pancreatic spasmolytic peptide (PSP), pSS or their biologically active fragments. The disruption is caused by microbial infection (viral, bacterial, or fungal infection). The viral infection is adenoviral infection or herpes simplex virus infection. The trefoil proteins of the invention are resistant to destruction in the dispestive tract and effectively treat eye diseases (e.g. corneal ulcer, ocular inflammatory disease) and have the ability to enhance corneal epithelial wound intestinal trefoil factor; pancreatic spasmolytic peptide; PSP; The invention relates to treating the disruption of the epithelium of the ps2; antinflammatory; ophthalmological; antibacterial; antiemetic; cytostatic; immunosuppressive; tranquiliser; vulnerary; antiapoptotic; eye epithelium; microbial infection; viral infection; antiapoptotic; bacterial infection; fungal infection; adenoviral infection; herpes simplex virus infection; eye disease; corneal ulcer; ocular inflammatory disease; corneal epithelial wound healing; diseative tract disorder; gastritis; ulcer; gastric cancer; MALT lymphoma; Menetrier's disease; inflammatory bowel disease. ö comprising oligonucleotides, effective for alleviating brines active agent, bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiaethmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ds. healing. The proteins are also useful in treating digestive tract disorders e.g. gastritis, ulcers, gastric cancer, MALT lymphoma. Menetrier's disease and inflammatory bowel disease. The present sequence is a NotI site which may be engineered onto isolated cDNA to facilitate invention describes a novel composition (a) a first active agent, Gaps ţ, oligonucleotide containing less percentage of adenosine, targeted t nucleic acids associated with lung airway or lung dysfunction, and ö Pabalan J, Aguilar Pharmaceutical composition for treating asthma, has antisense Human adenosine Al receptor oligonucleotide fragment 890. 0; Indels Length 10; Sequence 10 BP; 0 A; 4 C; 6 G; 0 T; 0 U; 0 Other; DB 1; Le 0; Mismatches Claim 15; SEQ ID NO 10269; 763pp; English. ы́ Score 7; D Pred. treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction and/or lung inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergies, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndröme; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ds.

Interior describes a movel composition (a) a first active agent, bronchoconstriction, respiratory tract inflammation, allergies and reductionstriction, respiratory tract inflammation, allergies and reductions described as essensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung of yetunction also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a composition nomposition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              with a disease or condition such as pulmonary vasoconstriction, finflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic thinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                          invention describes a novel composition (a) a first active agent.
                                                                                                                                         oligonucleotide containing less percentage of adenosine, targeted unucleic acids associated with lung airway or lung dysfunction, and
                                                                                                               Pharmaceutical composition for treating asthma, has antisense
                                                                                                                                                                                                                                                   Claim 15; SEQ ID NO 10258; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for advantage denosine sensitivity, levels of adenosine (A) or (A) receptors, ceducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, curfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating cyfunction or cancer and can be anti-sense to the corresponding mkNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostart activity, is a correcting a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to creduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction; inflammation, allergies, asthma, impeded respiration, respiratory confirmation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the maniferent of the anti-sense oligos corresponding to the mindient and thereby, to the resume the anti-sense oligos corresponding to the mindient and the target RNA serves to prevent the breakdown of the correct of the entire mention and thereby, etc., tissue environment and thereby, to Gaps S Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and Katz E, Pabalan J, Aguilar D; ; 0; Indels Score 7; DB 1; Length 10; Fred.                                comprising oligonucleotides, composition, (a, a list active agence, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  inflammation, allergies and/or surfactant hypoproduction are associated
invention describes a novel composition (a) a first active agent,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 10 BP; 2 A; 3 C; 5 G; 0 T; 0 U; 0 Other;

This invention relates to a novel method for the optimisation of primer olibraries. Specifically, it refers to increasing the affinity of short oligonucleotide primers, also known as extendable oligos (BOs), for their template sequences. The present invention describes improved methods for sequencing and the linear and exponential amplification of DNA that can be useful for PCR, RT-PCR, ligation chain reaction (LCR), rolling circle amplification, strand displacement amplification and isochermal DNA amplification. Accordingly, these extendable oligos with improved specificity and affinity are particularly important in fields ranging from biotechnology and agriculture to medical research. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    oligonucleotide sequence is an extendable oligonucleotide that includes an adenine replacement 2,4 diaminopurine nucleotide analogue in the catch region, and is useful for both DNA sequencing reactions and PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Increasing the affinity of an extendable oligonucleotide (EO) for a target nucleic acid, for providing primers having improved specificity, comprises hybridization of the EO to a template oligonucleotide (TO) and extension of the EO.
                                                                                                                                              ss; primer library; extendable oligo; EO; ligation chain reaction; LCR; rolling circle amplification; strand displacement amplification; isothermal DNA amplification; biotechnology; agriculture; medical research; 2,4 diaminopurine nucleotide analogue; PCR; primer.
                                                                                                             Extendable oligo E102 for DNA sequencing and PCR amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel method for the optimisation of primer libraries. Specifically, it refers to increasing the affinity of short oligonucleotide primers, also known as extendable oligos (EOS), for their template sequences. The present invention describes improved methods for sequencing and the linear and exponential amplification of DNA that can be useful for PCR, RT-PCR, ligation chain reaction (LCR), rolling circle amplification, strand displacement amplification and isothermal DNA amplification. Accordingly, these extendable oligos with improved specificity and affinity are particularly important in fields ranging from biotechnology and agriculture to medical research. This oligonucleotide sequence is an extendable oligonucleotide that includes an adenine replacement 2,4 diaminopurine nucleotide analogue in the catch region, and is useful for both DNA sequencing reactions and PCR amplification in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                     Increasing the affinity of an extendable oligonucleotide (EO) for a target nucleic acid, for providing primers having improved specificity, comprises hybridization of the EO to a template oligonucleotide (TO) and

gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1 and cystatin C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin-8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Diagnosing breast cancer comprises determining expression levels of a

                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                            ö
                                                                                                                                      The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin-8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer
                                                       Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cancerons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin

ö
expression in the test sample of a gene (e.g. interleukin-8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin-8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         comprises determining expression levels of a differentially expressed in normal or cancerous sample including interleukin 1, thrombospondin 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin.9, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                               gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1

The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin.8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (C) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                         The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin.8, meproxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer
                                                                                                                                                       Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1
                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                              The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. increleukin-g, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.
Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1 and cystatin C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin-8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        comprises determining expression levels of a differentially expressed in normal or cancerous sample including interleukin 1, thrombospondin 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.
test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying agents that alter biological activity of a polypeptide encoded by a polynucleotide involved in hypoxia-related tumorigenesis comprises contacting an agent with a target cell and monitoring activity

the involves contacting genomic DNA of a biological sample obtained from the involves contacting genomic DNA of a biological sample obtained from the subject with one or more reagent(s), or a series of reagents that distinguishes between methylated and non-methylated CDG dinuclectides of distinguishes between methylated and non-methylated CDG dinuclectides within a target sequence of the genomic DNA. The invention further comprises: a nucleic acid comprising a sequence of 18 or more contiguous comprises: a nucleic acid comprising a sequence of 18 or more contiguous nuclectide sequences. Whose sequence from any one of 284 tully defined nuclectide sequences, whose sequence listing is not browniguous sequence has one or more CDG. TDA, or CDA dinuclectide, and the treatment is suitable to convert one or more of the unmethylated contiguous sequence has one or more CDG. TDA, or CDA dinuclectide, and the treatment is suitably dissimilar to cytosine hase(s) of the genomic DNA sequence initially to uracil or or hybridization; an oligomer to peptide nucleic acid (PNA)-oligomer, comprising 9 or more contiguous nucleotides that is complementary to or hybridization; an oligomer to peptide nucleic acid (PNA)-oligomer, comprising 9 or more contiguous nucleotides that is complementary to or hybridization; and their complementary sequences provided in the conce document, which is treated; a set of oligomers comprising two or correct corrections and their complementary sequences comprising two or correct corrections of the oligomers of PNA-oligomer; an array of oligomers and a kit complementary for a carrying out the above methods. The method and its novel compositions there are useful for detecting and distinguishing the methods of the oligomers of the complementary coligomers and a kit of the coligomers of the oligomers are useful for detecting and distinguishing the methods are useful for a more of the oligomers of oligomers are useful for detecting and proved companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        between, or among, colorectal cell proliferative disorders chosen from colorectal carcinoma, colon adenomas and colon polyps, in a biological sample, such as histological slides, biopsies, paraffin embedded tissue, bodily fluids, stool, blood, serum, plasma and their combinations. The oligomer array is useful as a probe for detecting one or more of the cytosine methylation state, or single nucleotide polymorphisms within the genomic DNA or their complementary sequences. The polymorphisms within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for detecting and distinguishing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting and distinguishing colorectal cell proliferative disorders by contacting genomic DNA of biological sample with reagent that distinguishes methylated and non-methylated CpG dinucleotides within

The inventors have discovered a set of 112 haplotypes in the human neurotrophic tyrosine kinase, receptor, type 1 (NTRK1) gene ADZ67903 that care associated with the age of onset of Alzheimer's disease (AD). They have also discovered that the copy number of each of these NTRL can applotypes affects the age of onset of AD. If an individual has at least one copy of any of the 112 specified haplotypes, that individual is a later age of onset of AD than an individual having zero copies of any of the 112 paplotypes of onset of AD than an individual having zero copies of any of the 112 haplotypes as vach an individual being defined as 'age of onset of AD than an individual being defined as 'age of onset of applotypes is useful for predicting the age at which individuals who are considered in the or haplotypes are an individual being defined as 'age of onset of applotypes is useful for predicting the age at which individuals who are considered in the develop AD and to help confirm a chaptorypes will haplotypes with age of AD onset indicates that variation of certain MTRLI haplotypes with age of AD onset indicates that variation in the NTKRI gene should be considered in the development and clinical curials of drugs for treating MCI. AD and other neurodegenerative chapters. This correlation also provides a basis for pursuing NTRKI as a
                                                                                                                                                                                                               °
invention are useful for classifying, distinguishing between, or among, diagnosing or determining the predisposition for colorectal cell proliferative disorders, or for the therapy of colorectal cell proliferative disorders. This polymucleotide sequence represents a primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 φ

and other neurological diseases or conditions. Information is provided about the composition of each of 112 haplotypes, namely the location in the NTRKI gene of each of the polymorphic sites (PSs) and the identity of the reference and variant allela at each PS. An individual's genotype for the set of PSs is obtained by primer extension, allele-specific PCR, nucleic acid amplification, hybridization, mismatch detection, enzymatic nucleic acid cleavage or sequencing assay. The present sequence is that of a reverse primer extension oligonucleocide for detecting PS12 in haplotypes comprising preferred embodiments of age of onset markers I and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to genetic markers of the human neurotrophic tyrosine kinase, receptor, type I (NTRKI) gene AEA61960 that are associated with progression of Alzheimer's disease (ADD). 12 Polymorphic sites (PSS) have been discovered in the NTRKI gene of Gaucasian individuals with AD, and a set of 70 haplotypes having association with progression of AD have been identified. If an individual has 0 or 1 copy of any of haplotypes 1-11 and 67-70, or 0 copies of any of haplotypes 42-66, then that individual is defined as having a progression marker I and is more likely to exhibit a slower progression of AD than an individual having 2 copies of any of haplotypes 1-41 and 67-70, or at least I copy of any of haplotypes 42-66, such an individual being defined as having a progression marker II. Additional haplotypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Determining whether an individual has a progression marker I or progression marker II, useful for predicting an individual's progression of Alzheimer's disease, by determining whether the individual has any of

may be identified that are in linkage disequilibrium with any of haplotypes 1-70, referred to as linked haplotypes and substitute haplotypes 1-70, in which one or more of the RSs in the haplotypes of any of haplotypes 1-70, in which one or more of the RSs in the original haplotypes 1-70, in which one or more of the RSs in the original haplotype is substituted with another PS, where the allele at the substituting PS. The invention provides methods and kits for determining whether an individual has a progression marker I or a progression marker I. A method is also provided for predicting an individual's progression cognitive disorder. An individual's genclype for each PS may be obtained by primer extension, allele-specially a Caucasian diagnosed as having a cognitive disorder. An individual's gencype for each PS may be obtained by primer extension, allele-specific PCR, nucleic acid amplification, complementing as equencing assay. The present sequence is a reverse primer extension oligonucleotide that can be used to detect the allele at PSI2 of the CNTRKI gene. The 3' terminus of the oligonucleotide is complementary to the nucleotide located immediately adjacent to the PS. The complementary content in individual has a progression marker I or progression marker II

Detecting and/or differentiating prostate cell proliferative disorders in a subject by contacting genomic with reagent(s) that distinguishes between methylated and non-methylated CpG dinucleotides in target nucleic acida

Example 1; SEQ ID NO 932; 164pp; English.

The invention describes a method of detecting and/or differentiating between prostate cell proliferative disorders in a subject comprising

concenting general form solutions that distinguishes between methylated concentral general solutions that distinguishes between methylated concentral series of reagents within one or a combination of target nucleic acids e.g. HISTONE H4. Also described are: a treated mucleic acids e.g. HISTONE H4. Also described are: a treated concentral series of the carget nucleic acids e.g. HISTONE H4. Also described are: a treated from SEQ ID NO: 1.59, 1017-1028, 1116, 1171, where the treatment converts at leas one unmethylated cytosine base of the genomic DNA sequence to uracil or another base that is detectable dissimilar to cytosine in terms of hybridization; a nucleic acid comprising at lest 16 contiguous nucleotides of a treated genomic DNA sequence selected from SEQ ID NO: 60-295, 1029-1076, 1117-1120, 1172-1175 and sequence scomplementary to them; an oligomer comprising at sequence of at least 9 contiguous nucleotides that is complementary to, or hybridizes under moderately stringent or stringent conditions to a treated genomic conficting shing between or among prostate cell proliferative disorder of a subject comprising at least one of a bisulfite reagent, or a methylation-sensitive restringent or stringent confictions sequence acid molecule comprising a contiguous sequence at least 9 nucleotides that is complementary to, or hybridizes under moderately contiguent or stringent confiltions to a sequence selected from SEQ ID NO: 60-295, 1029-1076, 1117-1120, 1172-1175 and their complements. The method, nucleic acid, oligomer, set of oligonucleotide, and kit are useful for detecting and/or allogeneric entering the another confiltions to a sequence complements. The method, nucleic acid, oligomer, set of oligonucleotide, and kit are useful for detecting and/or differentiating between or among cell ö contacting genomic DNA isolated from a biological sample with at least Gaps proliferative disorders. This sequence represents a primer used to analyze methylation status of genes encoding a prostate cell ö 0; Indels 43.8%; Score 7; DB 1; Length 10; 100.0%; Pred. No. 3.4e+02; ative 0; Mismatches 0; Indels Sequence 10 BP; 0 A; 3 C; 7 G; 0 T; 0 U; 0 Other; Search completed: May 9, 2006, 16:45:22 proliferation associated protein. Query Match 43.8 Best Local Similarity 100. Matches 7; Conservative 5 GGCCGC 11 Job time : 1 secs 8

Sequence 1460, Application US/10712672

Publication No. US20040102413A1

GENERAL INCORMATION:

APPLICANT: Ribozyme Pharaceuticals, Inc.

APPLICANT: Chowriza, Bharat

APPLICANT: ACSWIGGEN, Jim

APPLICANT: Stinchcomb, Dan

TITLE OF INVENTION: Method and Reagent for the Inhibition of Telomerase Enzyme

FILE REFERENCE: MBHB00-882-C (400/019)

CURRENT FILING DATE: 2003-11-13

PRIOR APPLICATION NUMBER: US/10/712,672

CURRENT FILING DATE: 2000-04-14

PRIOR FILING DATE: 2000-04-14

Publication No. US20040241651A1
GENERAL INFORMATION:
APPLICANT: Alexander Olek
APPLICANT: Christian Piepenbrock
APPLICANT: Christian Defection of Single nucleotide polymorhphisms [SNPS] and cytosine
TITLE OF INVENTION: methylations
TITLE OF INVENTION: methylations
TITLE OF INVENTION: wethylations
FILE REFERENCE: E01/1193/WO
CURRENT APPLICATION NUMBER: US/10/257,017B
CURRENT APPLICATION NUMBER: DE 10019173.8
PRIOR APPLICATION NUMBER: DE 10019173.8
PRIOR PRIOR PILING DATE: 2000-04-07
NUMBER OF SEQ ID NOS: 382046
SEQ ID NO 229446
LENGTH: 13

Sequence 1425, Application US/09504231A

Sequence 1425, Application US/09504231A

Patent No. US20020013458A1

GENERAL INFORMATION:

APPLICANT: Blatt, Lawrence

APPLICANT: Roberts, Beth

APPLICANT: Roberts, Beth

APPLICANT: Macejak, Dennis

ITILE OF INVENTION: HERPATITIS C VIRUS INFECTION

TITLE OF INVENTION: HERPATITIS C VIRUS INFECTION

FILE REFERENCE: rpi 247/282

CURRENT APPLICATION NUMBER: US/09/504,231A

FILE REFERENCE: rpi 247/282

CURRENT FILING DATE: 1999-02-15

PRIOR FILING DATE: 1999-02-16

PRIOR FILING DATE: 1999-02-24

PRIOR FILING DATE: 1999-02-24

PRIOR FILING DATE: 1999-03-23

PRIOR FILING DATE: 1999-04-27

NUMBER OF SEQ ID NOS: 3242

SOFTWARE: Patentin version 3.0

SEQ ID NO 1425

LENGTH: 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       APPLICANT: Blatt, Lawrence
